

Esp-now-two-way Master + Slave experiment

Due of measuring of ECG and BPM I've started to tests all possibilities of ESP-NOW system. Thank to all helpers from Arduino IDE community and for their work and guides on and about this excellent communication system.

I have overcome some problem to create some sketches for these master (M) and slave (S) similar protocols and I think this protocols are suitable for simply realisations.

I was tested my M-S system with ESP8266 on NodeMcu or Wemos modules and here I offer this experimental system for next tests and for use for ECG or BPM measurements with modules as AD8232, HW-827 or HW-487 ones.

As the codes of my sketches are larger as for master station, as for two slave stations called by me as A and B, I get them better on Github.

There are sketch of Master station `Esp_now_NodeMcu_M_S1A2B_en_4.ino` and sketch of Slave station number 1 A `Esp_now_NodeMcu_S1A_M_en_4.ino`.

The code of slave station B is very similar to this one for A station and it is necessary to change the name of slaveNumber from 1 to 2 and slaveName from A to B and use right mac address of M station what is the same in both slave ones, and mac address of S (1A or 2B) stations in master sketch.
